6. Fraction Algebra

To add or subtract fractions, you must have a common denominator.

When finding the common denomination, you must find the LCM between the bottom numbers.

Examples: Simplify the following.

1. $\frac{x}{5}+\frac{x}{3}$

Note:

2. $\frac{2x^2}{3}-\frac{5x^2}{6}$

Note:

3. $\frac{x+4}{3}+\frac{2x-1}{8}$

Note:

4. $\frac{2x-1}{6}-\frac{x+3}{4}$

Note:

5. $\frac{3}{x}+\frac{1}{2x}$

Note:

6. $\frac{5}{x^2}-\frac{4}{x}$

7. $\frac{1}{x^2y}+\frac{1}{xy^2}$

Note:

8. $\frac{2}{5a^2b}+\frac{3}{10ab}$

7. Factorisation

Factorisation is the opposite of expanding.

$$\xrightarrow{\textit{expanding}}$$

$$a(b+c)=ab+ac$$

$$\xrightarrow{\textit{factorising}}$$

$$ab+ac=a(b+c)$$

A) Simple Factorisation

Always ask:

1. "What's common?"
2. "What's left?"

When factorizing, look at:

1. Numbers first
2. Then, letters in alphabetical order – taking the lowest power
3. What's left – again looking at numbers first, then letters

Examples: Factorise the following.

1. $2a + 6$

2. $a^2 + 2a$

3. $8x^2 - 6x$

Note:

4. $2a^3b^2 + 4ab^2$

5. $16a^4bc - 12a^3b^2$

B) Factorising out the negative

When dealing with negative terms, you must think about the following rules:

1. If the first term is negative, factorise out the (-) sign as well.
2. When taking out the (-) sign, it flips all the signs of the terms.

E.g. $-x - 3 = -(x + 3)$

Examples: Factorise the following.

1. $-5a - 26$

2. $-4x - 8$

3. $-4x^3 - 2x$

4. $-5m^2p + mp^3$

C) Complicated Factorisation

Whenever two terms have a common bracket, the entire bracket can be taken out.

You must ask:

1. "What's common"
2. "What's left"

Examples: Factorise the following.

1. $4(3x - 2) + x(3x - 2)$

Note:

2. $2(x + 1) - x(x + 1)$

Note:

3. $x(x^2 + 1) + (x^2 + 1)$

Note:

4. $2x(x^2 - 1) - (x^2 - 1)$

D) Simplifying Fractions with Brackets

Simplifying fractions with brackets

$$\frac{2(3)}{2} = 3$$

$$\frac{2 + 3}{3} \neq 3$$

$$\frac{2(x + 1)}{2} = x + 1$$

$$\frac{2 + (x + 1)}{2} \neq x + 1$$

Can only simplify fractions if there are multiplication of terms on the top AND bottom.

Sometimes need to factorise to get a multiplication of terms

E.g. $2x + 2 = 2(x + 1)$

Examples: Simplify the following.

1. $\frac{2x+4}{6}$

2. $\frac{x^2-3x}{3x}$

3. $\frac{3x^2-6x}{9x^2}$
